# SPRINT 3

To create a web application using Node-RED service.

Create a HTTP request to communicate with mobile app

HTTP transfers data in a hypertext format between the browse rand the web server, whereas HTTPS transfers data in an encrypted format. As a result, HTTPS protects websites from having their information broadcast in a way that anyone eavesdropping on the network can easily see. During the transitbetween the browser and the web server, HTTPS protects the data from being accessed and altered by hackers. Even if the transmission is intercepted, hackers will be unable to use it because the message is encrypted.

HOW HTTP WORKS
